

The Duck

Embedded Systems Design Project II

EGR314 Spring 2026

Levi Addink, K Phang, Kelton Jensen, Neel Garde, Austin Gonzalez,
Seth Merwin, Isaac Smith, Jacob Andrus, Michael Kim, Hafsa Kaysan

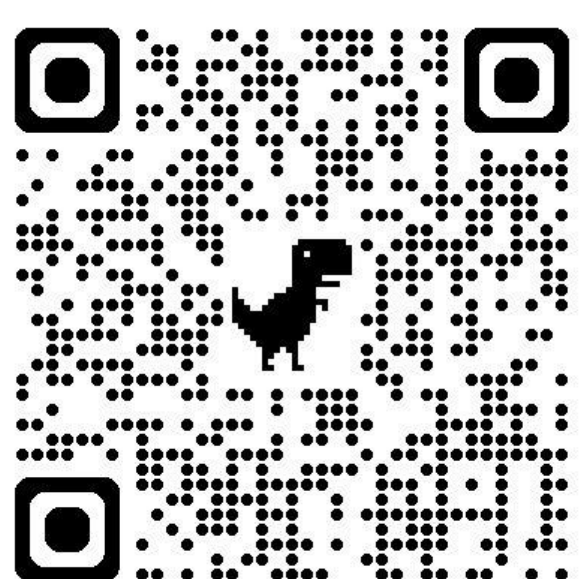

Project Description

This project presents a water-based exploration device capable of navigating aquatic environments to collect sensor data from objects of interest. The system utilizes an integrated sensor array to capture gyroscopic, distance, temperature, and image data, with wireless control and data transmission via Bluetooth.

Project Requirements

The device shall collect sensor data and transmit it wirelessly to a controller for display on an OLED screen.

The system shall maintain reliable communication with low latency and minimal packet loss.
